

Matplotlib Pyplot

Pyplot

Most of the Matplotlib utilities lies under the `pyplot` submodule, and are usually imported under the `plt` alias:

```
import matplotlib.pyplot as plt
```

Now the Pyplot package can be referred to as `plt`.

Example

Draw a line in a diagram from position (0,0) to position (6,250):

```
import matplotlib.pyplot as plt
import numpy as np
xpoints = np.array([0, 6])
ypoints = np.array([0, 250])
plt.plot(xpoints, ypoints)
plt.show()
```

Result:

Matplotlib Plotting

Plotting x and y points

The `plot()` function is used to draw points (markers) in a diagram.

UNIT-5 Data Visualization using dataframe

By default, the `plot()` function draws a line from point to point.

The function takes parameters for specifying points in the diagram.

Parameter 1 is an array containing the points on the **x-axis**.

Parameter 2 is an array containing the points on the **y-axis**.

If we need to plot a line from (1, 3) to (8, 10), we have to pass two arrays [1, 8] and [3, 10] to the plot function.

Example

Draw a line in a diagram from position (1, 3) to position (8, 10):

```
import matplotlib.pyplot as plt
```

```
import numpy as np
```

```
xpoints = np.array([1, 8])
```

```
ypoints = np.array([3, 10])
```

```
plt.plot(xpoints, ypoints)
```

```
plt.show()
```

Result:

Matplotlib Markers

Markers

You can use the keyword argument **marker** to emphasize each point with a specified marker:

Example

Mark each point with a circle:

```
import matplotlib.pyplot as plt
import numpy as np
```

```
ypoints = np.array([3, 8, 1, 10])
```

```
plt.plot(ypoints, marker = 'o')
plt.show()
```

Result:

Example

Mark each point with a star:

```
...
plt.plot(ypoints, marker = '*')
...
```

UNIT-5 Data Visualization using dataframe

Result:

Marker Reference

You can choose any of these markers:

Marker	Description
'o'	Circle
'*'	Star
'.'	Point
','	Pixel
'x'	X

UNIT-5 Data Visualization using dataframe

'X'	X (filled)
'+'	Plus
'p'	Plus (filled)
's'	Square
'D'	Diamond
'd'	Diamond (thin)
'p'	Pentagon
'H'	Hexagon
'h'	Hexagon
'v'	Triangle Down
'^'	Triangle Up

UNIT-5 Data Visualization using dataframe

'<'	Triangle Left
'>'	Triangle Right
'1'	Tri Down
'2'	Tri Up
'3'	Tri Left
'4'	Tri Right
' '	Vline
'_'	Hline

Format Strings **fmt**

You can use also use the *shortcut string notation* parameter to specify the marker.

This parameter is also called **fmt**, and is written with this syntax:

marker|line|color

Example

Mark each point with a circle:

UNIT-5 Data Visualization using dataframe

```
import matplotlib.pyplot as plt
import numpy as np
```

```
ypoints = np.array([3, 8, 1, 10])
```

```
plt.plot(ypoints, 'o:r')
plt.show()
```

Result:

The marker value can be anything from the Marker Reference above.

The line value can be one of the following:

Line Reference

Line Syntax	Description
'-'	Solid line
'.'	Dotted line

UNIT-5 Data Visualization using dataframe

'--'	Dashed line
'-.'	Dashed/dotted line

Note: If you leave out the *line* value in the *fmt* parameter, no line will be plotted.

The short color value can be one of the following:

Color Reference

Color Syntax	Description
'r'	Red
'g'	Green
'b'	Blue
'c'	Cyan
'm'	Magenta
'y'	Yellow

UNIT-5 Data Visualization using dataframe

'k'	Black
'w'	White

Marker Size

You can use the keyword argument **markersize** or the shorter version, **ms** to set the size of the markers:

Example

Set the size of the markers to 20:

```
import matplotlib.pyplot as plt
import numpy as np
```

```
ypoints = np.array([3, 8, 1, 10])
plt.plot(ypoints, marker = 'o', ms = 20)
plt.show()
```

Result:

Marker Color

You can use the keyword argument `markeredgecolor` or the shorter `mec` to set the color of the *edge* of the markers:

Example

Set the EDGE color to red:

```
import matplotlib.pyplot as plt
import numpy as np

ypoints = np.array([3, 8, 1, 10])

plt.plot(ypoints, marker = 'o', ms = 20, mec = 'r')
plt.show()
```

Result:

You can use the keyword argument `markerfacecolor` or the shorter `mfc` to set the color inside the edge of the markers:

Example

Set the FACE color to red:

```
import matplotlib.pyplot as plt
import numpy as np
```

UNIT-5 Data Visualization using dataframe

```
ypoints = np.array([3, 8, 1, 10])
```

```
plt.plot(ypoints, marker = 'o', ms = 20, mfc = 'r')  
plt.show()
```

Result:

Use *both* the `mec` and `mfc` arguments to color of the entire marker:

Example

Set the color of both the *edge* and the *face* to red:

```
import matplotlib.pyplot as plt  
import numpy as np
```

```
ypoints = np.array([3, 8, 1, 10])
```

```
plt.plot(ypoints, marker = 'o', ms = 20, mec = 'r', mfc = 'r')  
plt.show()
```

UNIT-5 Data Visualization using dataframe

Result:

You can also use [Hexadecimal color values](#):

Example

Mark each point with a beautiful green color:

...

```
plt.plot(ypoints, marker = 'o', ms = 20, mec = '#4CAF50', mfc = '#4CAF50')
```

...

Result:

Or any of the [140 supported color names](#).

UNIT-5 Data Visualization using dataframe

Example

Mark each point with the color named "hotpink":

...

```
plt.plot(ypoints, marker = 'o', ms = 20, mec = 'hotpink', mfc = 'hotpink')
```

...

Result:

Matplotlib Line

Linestyle

You can use the keyword argument **linestyle**, or shorter **ls**, to change the style of the plotted line:

Example

Use a dotted line:

```
import matplotlib.pyplot as plt
```

```
import numpy as np
```

```
ypoints = np.array([3, 8, 1, 10])
```

```
plt.plot(ypoints, linestyle = 'dotted')
```

```
plt.show()
```

UNIT-5 Data Visualization using dataframe

Result:

Example

Use a dashed line:

```
plt.plot(ypoints, linestyle = 'dashed')
```

Result:

Shorter Syntax

The line style can be written in a shorter syntax:

linestyle can be written as **ls**.

dotted can be written as **..**.

UNIT-5 Data Visualization using dataframe

dashed can be written as `--`.

Example

Shorter syntax:

```
plt.plot(ypoints, ls = 'r:')
```

Result:

Line Styles

You can choose any of these styles:

Style	Or
'solid' (default)	'_'
'dotted'	'.'
'dashed'	'--'

'dashdot'

'-.'

'None'

" or ''

Line Color

You can use the keyword argument **color** or the shorter **c** to set the color of the line:

Example

Set the line color to red:

```
import matplotlib.pyplot as plt
import numpy as np
```

```
ypoints = np.array([3, 8, 1, 10])
```

```
plt.plot(ypoints, color = 'r')
plt.show()
```

Result:

You can also use [Hexadecimal color values](#):

UNIT-5 Data Visualization using dataframe

Example

Plot with a beautiful green line:

```
...  
plt.plot(ypoints, c = '#4CAF50')  
...
```

Result:

Or any of the [140 supported color names](#).

Line Width

You can use the keyword argument **linewidth** or the shorter **lw** to change the width of the line.

The value is a floating number, in points:

Example

Plot with a 20.5pt wide line:

```
import matplotlib.pyplot as plt  
import numpy as np  
  
ypoints = np.array([3, 8, 1, 10])  
  
plt.plot(ypoints, linewidth = '20.5')  
plt.show()
```

Result:

Multiple Lines

Example

```
import matplotlib.pyplot as plt
import numpy as np
y1 = np.array([3, 8, 1, 10])
y2 = np.array([6, 2, 7, 11])
plt.plot(y1)
plt.plot(y2)
plt.show()
```

Result:

UNIT-5 Data Visualization using dataframe

You can also plot many lines by adding the points for the x- and y-axis for each line in the same `plt.plot()` function. The x- and y- values come in pairs:

Example

Draw two lines by specifying the x- and y-point values for both lines:

```
import matplotlib.pyplot as plt
import numpy as np
```

```
x1 = np.array([0, 1, 2, 3])
y1 = np.array([3, 8, 1, 10])
x2 = np.array([0, 1, 2, 3])
y2 = np.array([6, 2, 7, 11])
```

```
plt.plot(x1, y1, x2, y2)
plt.show()
```

Result:

Create Labels for a Plot

With Pyplot, you can use the `xlabel()` and `ylabel()` functions to set a label for the x- and y-axis.

Example

Add labels to the x- and y-axis:

```
import numpy as np
import matplotlib.pyplot as plt

x = np.array([80, 85, 90, 95, 100, 105, 110, 115, 120, 125])
y = np.array([240, 250, 260, 270, 280, 290, 300, 310, 320, 330])

plt.plot(x, y)

plt.xlabel("Average Pulse")
plt.ylabel("Calorie Burnage")

plt.show()
```

Result:

Create a Title for a Plot

With Pyplot, you can use the `title()` function to set a title for the plot.

Example

UNIT-5 Data Visualization using dataframe

Add a plot title and labels for the x- and y-axis:

```
import numpy as np
import matplotlib.pyplot as plt

x = np.array([80, 85, 90, 95, 100, 105, 110, 115, 120, 125])
y = np.array([240, 250, 260, 270, 280, 290, 300, 310, 320, 330])

plt.plot(x, y)

plt.title("Sports Watch Data")
plt.xlabel("Average Pulse")
plt.ylabel("Calorie Burnage")

plt.show()
```

Result:

Set Font Properties for Title and Labels

You can use the `fontdict` parameter in `xlabel()`, `ylabel()`, and `title()` to set font properties for the title and labels.

Example

Set font properties for the title and labels:

```
import numpy as np
import matplotlib.pyplot as plt
```

UNIT-5 Data Visualization using dataframe

```
x = np.array([80, 85, 90, 95, 100, 105, 110, 115, 120, 125])
y = np.array([240, 250, 260, 270, 280, 290, 300, 310, 320, 330])
```

```
font1 = {'family':'serif','color':'blue','size':20}
font2 = {'family':'serif','color':'darkred','size':15}
```

```
plt.title("Sports Watch Data", fontdict = font1)
plt.xlabel("Average Pulse", fontdict = font2)
plt.ylabel("Calorie Burnage", fontdict = font2)
```

```
plt.plot(x, y)
plt.show()
```

Result:

Position the Title

You can use the `loc` parameter in `title()` to position the title.

Legal values are: 'left', 'right', and 'center'. Default value is 'center'.

Example

Position the title to the left:

```
import numpy as np
import matplotlib.pyplot as plt
```

UNIT-5 Data Visualization using dataframe

```
x = np.array([80, 85, 90, 95, 100, 105, 110, 115, 120, 125])
y = np.array([240, 250, 260, 270, 280, 290, 300, 310, 320, 330])

plt.title("Sports Watch Data", loc = 'left')
plt.xlabel("Average Pulse")
plt.ylabel("Calorie Burnage")

plt.plot(x, y)
plt.show()
```

Result:

Matplotlib Adding Grid Lines

Add Grid Lines to a Plot

With Pyplot, you can use the `grid()` function to add grid lines to the plot.

Example

Add grid lines to the plot:

```
import numpy as np
import matplotlib.pyplot as plt

x = np.array([80, 85, 90, 95, 100, 105, 110, 115, 120, 125])
y = np.array([240, 250, 260, 270, 280, 290, 300, 310, 320, 330])
```

UNIT-5 Data Visualization using dataframe

```
plt.title("Sports Watch Data")
plt.xlabel("Average Pulse")
plt.ylabel("Calorie Burnage")
```

```
plt.plot(x, y)
```

```
plt.grid()
```

```
plt.show()
```

Result:

Specify Which Grid Lines to Display

You can use the **axis** parameter in the **grid()** function to specify which grid lines to display.

Legal values are: 'x', 'y', and 'both'. Default value is 'both'.

Example

Display only grid lines for the x-axis:

```
import numpy as np
```

```
import matplotlib.pyplot as plt
```

```
x = np.array([80, 85, 90, 95, 100, 105, 110, 115, 120, 125])
```

```
y = np.array([240, 250, 260, 270, 280, 290, 300, 310, 320, 330])
```

```
plt.title("Sports Watch Data")
```

UNIT-5 Data Visualization using dataframe

```
plt.xlabel("Average Pulse")  
plt.ylabel("Calorie Burnage")
```

```
plt.plot(x, y)
```

```
plt.grid(axis = 'x')
```

```
plt.show()
```

Result:

Example

Display only grid lines for the y-axis:

```
import numpy as np
```

```
import matplotlib.pyplot as plt
```

```
x = np.array([80, 85, 90, 95, 100, 105, 110, 115, 120, 125])
```

```
y = np.array([240, 250, 260, 270, 280, 290, 300, 310, 320, 330])
```

```
plt.title("Sports Watch Data")
```

```
plt.xlabel("Average Pulse")
```

```
plt.ylabel("Calorie Burnage")
```

```
plt.plot(x, y)
```

```
plt.grid(axis = 'y')
```

UNIT-5 Data Visualization using dataframe

plt.show()

Result:

Set Line Properties for the Grid

You can also set the line properties of the grid, like this: `grid(color = 'color', linestyle = 'linestyle', linewidth = number)`.

Example

Set the line properties of the grid:

```
import numpy as np
import matplotlib.pyplot as plt

x = np.array([80, 85, 90, 95, 100, 105, 110, 115, 120, 125])
y = np.array([240, 250, 260, 270, 280, 290, 300, 310, 320, 330])

plt.title("Sports Watch Data")
plt.xlabel("Average Pulse")
plt.ylabel("Calorie Burnage")

plt.plot(x, y)

plt.grid(color = 'green', linestyle = '--', linewidth = 0.5)

plt.show()
```

Result:

Matplotlib Subplot Display Multiple Plots

With the `subplot()` function you can draw multiple plots in one figure:

Example

Draw 2 plots:

```
import matplotlib.pyplot as plt
import numpy as np
```

#plot 1:

```
x = np.array([0, 1, 2, 3])
y = np.array([3, 8, 1, 10])
```

```
plt.subplot(1, 2, 1)
plt.plot(x,y)
```

#plot 2:

```
x = np.array([0, 1, 2, 3])
y = np.array([10, 20, 30, 40])
```

```
plt.subplot(1, 2, 2)
plt.plot(x,y)
```

```
plt.show()
```

Result:

The subplot() Function

The `subplot()` function takes three arguments that describes the layout of the figure.

The layout is organized in rows and columns, which are represented by the *first* and *second* argument.

The third argument represents the index of the current plot.

```
plt.subplot(1, 2, 1)  
#the figure has 1 row, 2 columns, and this plot is the first plot.
```

```
plt.subplot(1, 2, 2)  
#the figure has 1 row, 2 columns, and this plot is the second plot.
```

So, if we want a figure with 2 rows and 1 column (meaning that the two plots will be displayed on top of each other instead of side-by-side), we can write the syntax like this:

Example

Draw 2 plots on top of each other:

UNIT-5 Data Visualization using dataframe

```
import matplotlib.pyplot as plt
import numpy as np
```

#plot 1:

```
x = np.array([0, 1, 2, 3])
y = np.array([3, 8, 1, 10])
```

```
plt.subplot(2, 1, 1)
plt.plot(x,y)
```

#plot 2:

```
x = np.array([0, 1, 2, 3])
y = np.array([10, 20, 30, 40])
```

```
plt.subplot(2, 1, 2)
plt.plot(x,y)
```

```
plt.show()
```

Result:

You can draw as many plots you like on one figure, just describe the number of rows, columns, and the index of the plot.

Example

Draw 6 plots:

UNIT-5 Data Visualization using dataframe

```
import matplotlib.pyplot as plt
import numpy as np
```

```
x = np.array([0, 1, 2, 3])
y = np.array([3, 8, 1, 10])
```

```
plt.subplot(2, 3, 1)
plt.plot(x,y)
```

```
x = np.array([0, 1, 2, 3])
y = np.array([10, 20, 30, 40])
```

```
plt.subplot(2, 3, 2)
plt.plot(x,y)
```

```
x = np.array([0, 1, 2, 3])
y = np.array([3, 8, 1, 10])
```

```
plt.subplot(2, 3, 3)
plt.plot(x,y)
```

```
x = np.array([0, 1, 2, 3])
y = np.array([10, 20, 30, 40])
```

```
plt.subplot(2, 3, 4)
plt.plot(x,y)
```

```
x = np.array([0, 1, 2, 3])
y = np.array([3, 8, 1, 10])
```

```
plt.subplot(2, 3, 5)
plt.plot(x,y)
```

```
x = np.array([0, 1, 2, 3])
y = np.array([10, 20, 30, 40])
```

```
plt.subplot(2, 3, 6)
plt.plot(x,y)
```

```
plt.show()
```

UNIT-5 Data Visualization using dataframe

Result:

Title

You can add a title to each plot with the `title()` function:

Example

2 plots, with titles:

```
import matplotlib.pyplot as plt
import numpy as np
```

#plot 1:

```
x = np.array([0, 1, 2, 3])
y = np.array([3, 8, 1, 10])
```

```
plt.subplot(1, 2, 1)
plt.plot(x,y)
plt.title("SALES")
```

#plot 2:

```
x = np.array([0, 1, 2, 3])
y = np.array([10, 20, 30, 40])
```

```
plt.subplot(1, 2, 2)
plt.plot(x,y)
plt.title("INCOME")
```

UNIT-5 Data Visualization using dataframe

plt.show()

Result:

Super Title

You can add a title to the entire figure with the `suptitle()` function:

Example

Add a title for the entire figure:

```
import matplotlib.pyplot as plt
import numpy as np
```

#plot 1:

```
x = np.array([0, 1, 2, 3])
y = np.array([3, 8, 1, 10])
```

```
plt.subplot(1, 2, 1)
plt.plot(x,y)
plt.title("SALES")
```

#plot 2:

```
x = np.array([0, 1, 2, 3])
y = np.array([10, 20, 30, 40])
```

```
plt.subplot(1, 2, 2)
```

UNIT-5 Data Visualization using dataframe

```
plt.plot(x,y)
plt.title("INCOME")
```

```
plt.suptitle("MY SHOP")
plt.show()
```

Result:

Matplotlib Scatter

Creating Scatter Plots

With Pyplot, you can use the `scatter()` function to draw a scatter plot.

The `scatter()` function plots one dot for each observation. It needs two arrays of the same length, one for the values of the x-axis, and one for values on the y-axis:

Example

A simple scatter plot:

```
import matplotlib.pyplot as plt
import numpy as np

x = np.array([5,7,8,7,2,17,2,9,4,11,12,9,6])
y = np.array([99,86,87,88,111,86,103,87,94,78,77,85,86])

plt.scatter(x, y)
plt.show()
```

UNIT-5 Data Visualization using dataframe

Result:

The observation in the example above is the result of 13 cars passing by.

The X-axis shows how old the car is.

The Y-axis shows the speed of the car when it passes.

Are there any relationships between the observations?

It seems that the newer the car, the faster it drives, but that could be a coincidence, after all we only registered 13 cars.

Compare Plots

In the example above, there seems to be a relationship between speed and age, but what if we plot the observations from another day as well? Will the scatter plot tell us something else?

Example

Draw two plots on the same figure:

```
import matplotlib.pyplot as plt
import numpy as np

#day one, the age and speed of 13 cars:
x = np.array([5,7,8,7,2,17,2,9,4,11,12,9,6])
y = np.array([99,86,87,88,111,86,103,87,94,78,77,85,86])
plt.scatter(x, y)
```

UNIT-5 Data Visualization using dataframe

#day two, the age and speed of 15 cars:

```
x = np.array([2,2,8,1,15,8,12,9,7,3,11,4,7,14,12])
```

```
y = np.array([100,105,84,105,90,99,90,95,94,100,79,112,91,80,85])
```

```
plt.scatter(x, y)
```

```
plt.show()
```

Result:

Note: The two plots are plotted with two different colors, by default blue and orange, you will learn how to change colors later in this chapter.

By comparing the two plots, I think it is safe to say that they both gives us the same conclusion: the newer the car, the faster it drives.

Colors

You can set your own color for each scatter plot with the `color` or the `c` argument:

Example

Set your own color of the markers:

```
import matplotlib.pyplot as plt
```

```
import numpy as np
```

```
x = np.array([5,7,8,7,2,17,2,9,4,11,12,9,6])
```

```
y = np.array([99,86,87,88,111,86,103,87,94,78,77,85,86])
```

UNIT-5 Data Visualization using dataframe

```
plt.scatter(x, y, color = 'hotpink')
```

```
x = np.array([2,2,8,1,15,8,12,9,7,3,11,4,7,14,12])
```

```
y = np.array([100,105,84,105,90,99,90,95,94,100,79,112,91,80,85])
```

```
plt.scatter(x, y, color = '#88c999')
```

```
plt.show()
```

Result:

Color Each Dot

You can even set a specific color for each dot by using an array of colors as value for the **c** argument:

Note: You *cannot* use the **color** argument for this, only the **c** argument.

Example

Set your own color of the markers:

```
import matplotlib.pyplot as plt
```

```
import numpy as np
```

```
x = np.array([5,7,8,7,2,17,2,9,4,11,12,9,6])
```

```
y = np.array([99,86,87,88,111,86,103,87,94,78,77,85,86])
```

```
colors =
```

```
np.array(["red", "green", "blue", "yellow", "pink", "black", "orange", "purple", "beige", "brown", "gray", "c
```

UNIT-5 Data Visualization using dataframe

```
yan","magenta"])
```

```
plt.scatter(x, y, c=colors)
```

```
plt.show()
```

Result:

ColorMap

The Matplotlib module has a number of available colormaps.

A colormap is like a list of colors, where each color has a value that ranges from 0 to 100.

Here is an example of a colormap:

UNIT-5 Data Visualization using dataframe

This colormap is called 'viridis' and as you can see it ranges from 0, which is a purple color, and up to 100, which is a yellow color.

How to Use the ColorMap

You can specify the colormap with the keyword argument `cmap` with the value of the colormap, in this case `'viridis'` which is one of the built-in colormaps available in Matplotlib.

In addition you have to create an array with values (from 0 to 100), one value for each of the point in the scatter plot:

Example

Create a color array, and specify a colormap in the scatter plot:

```
import matplotlib.pyplot as plt
import numpy as np

x = np.array([5,7,8,7,2,17,2,9,4,11,12,9,6])
y = np.array([99,86,87,88,111,86,103,87,94,78,77,85,86])
colors = np.array([0, 10, 20, 30, 40, 45, 50, 55, 60, 70, 80, 90, 100])

plt.scatter(x, y, c=colors, cmap='viridis')

plt.show()
```

Result:

Size

You can change the size of the dots with the `s` argument.

Just like colors, make sure the array for sizes has the same length as the arrays for the x- and y-axis:

Example

Set your own size for the markers:

```
import matplotlib.pyplot as plt
```

```
import numpy as np
```

```
x = np.array([5,7,8,7,2,17,2,9,4,11,12,9,6])
```

```
y = np.array([99,86,87,88,111,86,103,87,94,78,77,85,86])
```

```
sizes = np.array([20,50,100,200,500,1000,60,90,10,300,600,800,75])
```

```
plt.scatter(x, y, s=sizes)
```

```
plt.show()
```

Result:

Alpha

You can adjust the transparency of the dots with the `alpha` argument.

Just like colors, make sure the array for sizes has the same length as the arrays for the x- and y-axis:

UNIT-5 Data Visualization using dataframe

Example

Set your own size for the markers:

```
import matplotlib.pyplot as plt
import numpy as np

x = np.array([5,7,8,7,2,17,2,9,4,11,12,9,6])
y = np.array([99,86,87,88,111,86,103,87,94,78,77,85,86])
sizes = np.array([20,50,100,200,500,1000,60,90,10,300,600,800,75])

plt.scatter(x, y, s=sizes, alpha=0.5)

plt.show()
```

Result:

Combine Color Size and Alpha

You can combine a colormap with different sizes on the dots. This is best visualized if the dots are transparent:

Example

Create random arrays with 100 values for x-points, y-points, colors and sizes:

```
import matplotlib.pyplot as plt
import numpy as np
```

UNIT-5 Data Visualization using dataframe

```
x = np.random.randint(100, size=(100))
y = np.random.randint(100, size=(100))
colors = np.random.randint(100, size=(100))
sizes = 10 * np.random.randint(100, size=(100))

plt.scatter(x, y, c=colors, s=sizes, alpha=0.5, cmap='nipy_spectral')

plt.colorbar()

plt.show()
```

Result:

Matplotlib Bars

Creating Bars

With Pyplot, you can use the `bar()` function to draw bar graphs:

Example

Draw 4 bars:

```
import matplotlib.pyplot as plt
import numpy as np

x = np.array(["A", "B", "C", "D"])
```

UNIT-5 Data Visualization using dataframe

```
y = np.array([3, 8, 1, 10])
```

```
plt.bar(x,y)
```

```
plt.show()
```

Result:

The `bar()` function takes arguments that describes the layout of the bars.

The categories and their values represented by the *first* and *second* argument as arrays.

Example

```
x = ["APPLES", "BANANAS"]
```

```
y = [400, 350]
```

```
plt.bar(x, y)
```

Horizontal Bars

If you want the bars to be displayed horizontally instead of vertically, use the `barh()` function:

Example

Draw 4 horizontal bars:

```
import matplotlib.pyplot as plt
```

```
import numpy as np
```

```
x = np.array(["A", "B", "C", "D"])
```

UNIT-5 Data Visualization using dataframe

```
y = np.array([3, 8, 1, 10])
```

```
plt.barh(x, y)
```

```
plt.show()
```

Result:

Bar Color

The `bar()` and `barh()` takes the keyword argument `color` to set the color of the bars:

Example

Draw 4 red bars:

```
import matplotlib.pyplot as plt
```

```
import numpy as np
```

```
x = np.array(["A", "B", "C", "D"])
```

```
y = np.array([3, 8, 1, 10])
```

```
plt.bar(x, y, color = "red")
```

```
plt.show()
```

Result:

Color Names

You can use any of the [140 supported color names](#).

Example

Draw 4 "hot pink" bars:

```
import matplotlib.pyplot as plt
import numpy as np
```

```
x = np.array(["A", "B", "C", "D"])
y = np.array([3, 8, 1, 10])
plt.bar(x, y, color = "hotpink")
plt.show()
```

Result:

Color Hex

Or you can use [Hexadecimal color values](#):

Example

Draw 4 bars with a beautiful green color:

```
import matplotlib.pyplot as plt
import numpy as np
```

```
x = np.array(["A", "B", "C", "D"])
y = np.array([3, 8, 1, 10])
```

```
plt.bar(x, y, color = "#4CAF50")
plt.show()
```

Result:

Bar Width

The `bar()` takes the keyword argument `width` to set the width of the bars:

Example

Draw 4 very thin bars:

```
import matplotlib.pyplot as plt
import numpy as np
```

UNIT-5 Data Visualization using dataframe

```
x = np.array(["A", "B", "C", "D"])
y = np.array([3, 8, 1, 10])
```

```
plt.bar(x, y, width = 0.1)
plt.show()
```

Result:

The default width value is 0.8

Note: For horizontal bars, use **height** instead of **width**.

Bar Height

The **barh()** takes the keyword argument **height** to set the height of the bars:

Example

Draw 4 very thin bars:

```
import matplotlib.pyplot as plt
import numpy as np
```

```
x = np.array(["A", "B", "C", "D"])
y = np.array([3, 8, 1, 10])
```

```
plt.barh(x, y, height = 0.1)  
plt.show()
```

Result:

Matplotlib Histograms

Histogram

A histogram is a graph showing *frequency* distributions.

It is a graph showing the number of observations within each given interval.

Example: Say you ask for the height of 250 people, you might end up with a histogram like this:

UNIT-5 Data Visualization using dataframe

You can read from the histogram that there are approximately:

2 people from 140 to 145cm
5 people from 145 to 150cm
15 people from 151 to 156cm
31 people from 157 to 162cm
46 people from 163 to 168cm
53 people from 168 to 173cm
45 people from 173 to 178cm
28 people from 179 to 184cm
21 people from 185 to 190cm
4 people from 190 to 195cm

Create Histogram

In Matplotlib, we use the `hist()` function to create histograms.

The `hist()` function will use an array of numbers to create a histogram, the array is sent into the function as an argument.

For simplicity we use NumPy to randomly generate an array with 250 values, where the values will concentrate around 170, and the standard deviation is 10. Learn more about [Normal Data Distribution](#) in our [Machine Learning Tutorial](#).

Example

A Normal Data Distribution by NumPy:

```
import numpy as np
```

```
x = np.random.normal(170, 10, 250)
```

```
print(x)
```

Result:

This will generate a *random* result, and could look like this:

```
[167.62255766 175.32495609 152.84661337 165.50264047 163.17457988
162.29867872 172.83638413 168.67303667 164.57361342 180.81120541

```

UNIT-5 Data Visualization using dataframe

The `hist()` function will read the array and produce a histogram:

Example

A simple histogram:

```
import matplotlib.pyplot as plt
import numpy as np
```

```
x = np.random.normal(170, 10, 250)
```

```
plt.hist(x)
plt.show()
```

Result:

Matplotlib Pie Charts

Creating Pie Charts

With Pyplot, you can use the `pie()` function to draw pie charts:

Example

A simple pie chart:

```
import matplotlib.pyplot as plt
import numpy as np
```

UNIT-5 Data Visualization using dataframe

```
y = np.array([35, 25, 25, 15])
```

```
plt.pie(y)  
plt.show()
```

Result:

As you can see the pie chart draws one piece (called a wedge) for each value in the array (in this case [35, 25, 25, 15]).

By default the plotting of the first wedge starts from the x-axis and move *counterclockwise*:

Note: The size of each wedge is determined by comparing the value with all the other values, by using this formula:

The value divided by the sum of all values: $x/\text{sum}(x)$

Labels

Add labels to the pie chart with the `label` parameter.

The `label` parameter must be an array with one label for each wedge:

Example

A simple pie chart:

```
import matplotlib.pyplot as plt
import numpy as np

y = np.array([35, 25, 25, 15])
mylabels = ["Apples", "Bananas", "Cherries", "Dates"]

plt.pie(y, labels = mylabels)
plt.show()
```

Result:

Start Angle

As mentioned the default start angle is at the x-axis, but you can change the start angle by specifying a `startangle` parameter.

The `startangle` parameter is defined with an angle in degrees, default angle is 0:

UNIT-5 Data Visualization using dataframe

Example

Start the first wedge at 90 degrees:

```
import matplotlib.pyplot as plt
```

```
import numpy as np
```

```
y = np.array([35, 25, 25, 15])
```

```
mylabels = ["Apples", "Bananas", "Cherries", "Dates"]
```

```
plt.pie(y, labels = mylabels, startangle = 90)
```

```
plt.show()
```

Result:

Explode

Maybe you want one of the wedges to stand out? The **explode** parameter allows you to do that.

The **explode** parameter, if specified, and not **None**, must be an array with one value for each wedge.

Each value represents how far from the center each wedge is displayed:

Example

Pull the "Apples" wedge 0.2 from the center of the pie:

```
import matplotlib.pyplot as plt
import numpy as np

y = np.array([35, 25, 25, 15])
mylabels = ["Apples", "Bananas", "Cherries", "Dates"]
myexplode = [0.2, 0, 0, 0]

plt.pie(y, labels = mylabels, explode = myexplode)
plt.show()
```

Result:

Shadow

Add a shadow to the pie chart by setting the `shadows` parameter to `True`:

Example

Add a shadow:

```
import matplotlib.pyplot as plt
import numpy as np

y = np.array([35, 25, 25, 15])
mylabels = ["Apples", "Bananas", "Cherries", "Dates"]
myexplode = [0.2, 0, 0, 0]

plt.pie(y, labels = mylabels, explode = myexplode, shadow = True)
plt.show()
```

Result:

Colors

You can set the color of each wedge with the `colors` parameter.

The `colors` parameter, if specified, must be an array with one value for each wedge:

Example

UNIT-5 Data Visualization using dataframe

Specify a new color for each wedge:

```
import matplotlib.pyplot as plt
import numpy as np

y = np.array([35, 25, 25, 15])
mylabels = ["Apples", "Bananas", "Cherries", "Dates"]
mycolors = ["black", "hotpink", "b", "#4CAF50"]

plt.pie(y, labels = mylabels, colors = mycolors)
plt.show()
```

Result

You can use [Hexadecimal color values](#), any of the [140 supported color names](#), or one of these shortcuts:

- 'r' - Red
- 'g' - Green
- 'b' - Blue
- 'c' - Cyan
- 'm' - Magenta
- 'y' - Yellow
- 'k' - Black
- 'w' - White

Legend

To add a list of explanation for each wedge, use the `legend()` function:

Example

Add a legend:

```
import matplotlib.pyplot as plt
import numpy as np

y = np.array([35, 25, 25, 15])
mylabels = ["Apples", "Bananas", "Cherries", "Dates"]

plt.pie(y, labels = mylabels)
plt.legend()
plt.show()
```

Result:

Legend With Header

To add a header to the legend, add the `title` parameter to the `legend` function.

Example

Add a legend with a header:

UNIT-5 Data Visualization using dataframe

```
import matplotlib.pyplot as plt
import numpy as np

y = np.array([35, 25, 25, 15])
mylabels = ["Apples", "Bananas", "Cherries", "Dates"]

plt.pie(y, labels = mylabels)
plt.legend(title = "Four Fruits:")
plt.show()
```

Result:
